

Assignment 6

The project draws to a close, you can see the finish line. All that remains is to polish the application and do the launch event. Then the CEO comes in with the news that the company was bought out and he personally made a lot of money.

Your new corporate overlords inspect your work and think that it needs to be expanded, they hire a bunch of people to help. You swear these people think that 9 women can deliver a baby in a month.

- Join with the subgroup from the list below to finally become one team (20+ students). Assignments are done by, and grades will be awarded to the new team. The team will present their work at their second lab. The first lab will not be held.

921/1 + 923/1
923/2 + 922/2

922/1 + 927/1
927/2 + 925/2

924/1 + 924/2
926/1 + 925/1

926/2 + 921/2

- The four leads will split into four roles:
 - Project manager
 - Quality assurance lead
 - Desktop technical lead
 - Web technical lead
- Project manager responsibilities:
 - Communications hub
 - Task prioritization and allocation of team members
 - Presents the demo
 - Breaks down grade and creates activity report
- Quality assurance lead responsibilities:
 - Manual and automated testing task creation of the applications
 - May create testing procedure and scenarios
 - Creation of bug tickets detailing what is wrong and how to reproduce it
 - Code review for all unit testing pull requests
- Desktop technical lead responsibilities:
 - Task creation for all things desktop (this might include the api layer)
 - Code reviews all desktop related pull requests, ensuring code quality and uniformity is maintained
- Web technical lead responsibilities:
 - Task creation for all things web (this might include the service and repository)
 - Code reviews all desktop related pull requests, ensuring code quality and uniformity is maintained
- Depending on your architecture the service and repository may be in a separate project from desktop / web, or it might be part of one of the web projects. However you decided to implement your solution, decide how the responsibilities are split, how students are allocated, and who does the deployments.
- Create a new GitHub repository with the name: UBB-SE-2025-[Banking / Steam / Duo / Marketplace / Beer / Workout / Hospital] (e.g. UBB-SE-2025-Banking). Invite the client (imre.zsigmond@ubbcluj.ro) as a collaborator.

- Merge the two projects into a singular solution. The coding style and architecture must be the same. There must be a single database for all of your data. All functionalities are to be accessible from the UI.
- Attempt to “finish” the application. All functionalities must use the real data sources instead of the dummy ones created for earlier versions. Fix all the bugs. Within reason, implement missing functionalities that would make the application make more sense. So if a couple of changes would make you be prouder of the final product, then do it.
- Your desktop applications must run in parallel with your website. If you chose to also separate your business logic last assignment, then you should be fine. If not, then you must now remove the business logic from the desktop and web applications. Change the APIs to expose the service layer instead of the repository. Change the desktop applications to call the new APIs. The server will have their ASP.NET core MVC GUI, and ASP.NET core API both use the same business logic, which will in turn use the same database access.
- Since you have two servers, try to use one for testing and one for production.
- Leads may denote their pick for "a +1 grade to any student" until their last lab after which it will default to them.

Deadline: lab 7, the second lab in the timetable

About the product launch:

- At the last week of the semester, you will present your finished project in front of your peers
- For the projects that finished before the last course (last lab is on odd weeks) you will present your project before your peers at the last course. For everybody else the presentation will be held Saturday the same week. The solution must be shown from the deployed site and locally running application that connects to it. Present the project then the running applications.
- The presentation will be judged by a panel of 3 lab assistants.
- This is the culmination of all your work, this is your time to show off! The team presenting will receive a +0.01 bonus for each applauding non-team-member colleagues in the room to their final grade.
- To qualify, liveblogs must be sent to Imre before Friday, 30th of May (week 13).
