

Lab rules

- No attendance is tracked, but activities are graded. By not joining your team without an objective reason, any grade or abandonment charge cannot be disputed later.
- Forming a team: By default, form 2 roughly equal numbered teams from all members of the subgroup, this should yield 6-7 student teams. The experience is designed around this range. You can move to another subgroup to join a team for whatever reason with the following restrictions:
 - If there are already 7 or more students there, you can only join if somebody moves to another team
 - If by leaving the current team would have less than 6 students, you must convince somebody to take your place
 - All team swapping must be finalized by the second lab
 - Retake/Erasmus students do not count against the 6-7 rule but with them the total count must not exceed 8
 - The team will also choose a team leader.
 - If the team size has changed after the requirements have been subdivided (first seminar) add or subtract requirements to fit the new size
 - In case of adding requirements, team leads must talk to the other teams in the group to ensure the requirement is not duplicated
- All activities must be attended with your team, at your regular lab time and location.
- Lab assignments must be handed in on time to qualify for maximum grade, being 1 lab late (2 weeks) sets the maximum to 5, being 2 labs late (~1 month) sets the maximum to 0. Official holidays to not count for being late.
- Lab and seminar activity is 100% of the final grade.
- You will receive 6 grades. Their relative weight on the final grade will differ.
- You will be responsible for a certain feature.
- Your team lead may present your work if you cannot attend.
- The team lead will present a report before demoing their work on the contributions of each team member, ideally task/git/chat/sent files history etc. With the scope of proving that each team member did some non-negligible amount of work.
- A student with 2 counts of no or negligible work, is considered to have abandoned their team and have failed the course (they are welcome in the retake session for a regular exam). Features that were assigned to that student should be dropped from the workload or somebody else can take them and drop their feature instead.
- When an assignment is presented, the team will be given a grade. The team lead will then present a breakdown of that grade per team member who contributed, to the lab assistant. The average of the individual grades may not exceed the grade given. So, let's say that for a given assignment a 6-student team received the grade of 8.5. The team lead may say that:
 - Three students will get a grade of 8 and three will get a grade of 9.
 - Or everybody gets an 8.
 - Or two get a 10, three will get an 8, and one gets a 7.
 - Or five get a 10, and one gets a 1.
 - Or any combination of grades
 - Any fraction left over is lost, so in the previous example if everybody gets 8 then the remaining $6 \cdot 0.5$ is lost.
- At the last lab, the team leader in exchange for their extra responsibilities can increase the grade of any one student by 1. If they do not choose anybody, it will default to them.
