Communication

Use case diagram

Use Case	Draw Image
Pre-condition	• Frame buffer must be cleared • Reset must switch off
Post-condition	• Image data output to VRAM
Basic path	1. This use case starts while Host CPU has already prepared the display list for drawing image. 2. Host CPU writes display list system's FIFO. 3. 2D/3D Graphics reads display list from FIFO and starts drawing image according to commands of display list. 4. 2D/3D Graphics outputs image data to VRAM.
Alternative path	At step 2 of the basic path, Host CPU writes display list that includes SYNC command to system's FIFO. At step 3 of the basic path, 2D/3D Graphics stops after reading SYNC command, and then 2D/3D graphics restarts drawing image after receiving a blank pulse from LCDC.
Exceptional path	At step 2 of the basic path, Host CPU writes display list includes undefined commands. At step 3 of basic path, 2D/3D graphics raises an error interrupt to Host CPU and clears system's FIFO.

Class diagram

SomeClassName
-Attribute1: Product #Attribute2: int
+Operation1(Parameter1: int, Parameter2: Product): int

```
public class SomeClassName
{
    private Product Attribute1;
    protected int Attribute2;

    public int Operation1(int Parameter1, Product Parameter2)
    {
        return 0;
    }
}
```

Cell

Cell

Conceptual

Cell
-expression
-value
+evaluate the expr()

Cell
-expression : Expression
-value : Value
+evaluate(Spreadsheet)

Specification

Cell
-expression : Expression = null
-value : Value = null
+evaluate(Spreadsheet)
+getFormula() : Expression
+setFormula(Expression)
+getValue() : Value

Implementation

```
class a {  
    b _ = new b();  
}
```

```
class c : d { }
```

```
class e  
{  
    void operation(f input) { }  
}
```

`SomeClass` exactlyOne;

`SomeClass?` zeroOrOne;

`IEnumerable<SomeClass>?` zeroOrMany;

`IEnumerable<SomeClass>` oneOrMany;
