

Assignment 1

Domain and Entity Selection + Figma Mockups

The goal of this first lab assignment is to get you started on your semester-long project. You will:

1. Choose a domain (e.g., travel, finance, healthcare, e-commerce, education, sports, etc.) and define a single *entity* that your application will manage. *Ensure that **no two students** in the same subgroup have the **same entity**.*
2. Begin creating **Figma mockups** that reflect the basic CRUD (Create, Read, Update, Delete) functionalities for your chosen entity.

1. Select Your Domain & Entity

- Think of a domain you are interested in (for example, a "Books" management app if you love reading, or an "Equipment" management app for sports gear, etc.).
- Clearly define the *entity* within this domain that your application will manage. For instance:
 1. Domain: **Retail** → Entity: **Products**
 2. Domain: **Education** → Entity: **Students**
 3. Domain: **Healthcare** → Entity: **Patient Records**
- Once you have decided, add your chosen entity to the shared Google Sheet: [Google Sheet for Entity Selection](#)
Note: Check the sheet before choosing to avoid duplicates within your subgroup.

2. Figma Mockups

- **Create a new Figma project** (or file) dedicated to your future app.
- Your Figma design should **showcase three primary flows**:
 1. **Adding (Create) the Entity**
 - A form or dialog showing how a user inputs data to create a new entity.
 - Include relevant input fields, labels, and any error/validation states.
 2. **Listing & Filtering (Read) the Entity**
 - A main screen or page displaying a list of existing entities.
 - At least one method of filtering or searching (e.g., by name, category, date).
 3. **Editing & Deleting (Update & Delete) the Entity**
 - A flow that shows how a user accesses an existing entity's details and edits them.
 - A confirmation prompt or process for deletion.

Figma Requirements (Industry Practices)

- **Use Frames**
 1. Organize your screens using frames (e.g., desktop, mobile) and apply auto layout to streamline responsiveness and spacing.
- **Create & Use Components**
 1. Common UI elements (buttons, form fields, modals) should be converted into reusable components.
 2. Utilize variants if appropriate (e.g., a “Primary” vs. “Secondary” button).
- **Maintain Consistent Design**
 1. Define or at least outline a basic design system: consistent color palette, typography, and button styles.
 2. Use consistent naming conventions for frames, components, and layers.
- **Include Interaction or Prototyping**
 1. Link your frames to simulate navigation (e.g., a button for “Add” leads to the Add Entity form).
 2. Demonstrate how users move from listing to editing, or how a delete confirmation might appear.

Submission Guidelines

- **Deadline:** Provide a link to your Figma file and confirm your chosen entity in the Google Sheet by the end of the laboratory..
- In your submission (or during the lab presentation), be prepared to briefly **walk through**:
 1. Your domain and why you chose it.
 2. The main screens in your Figma file (Add, List & Filter, Edit, Delete).
 3. How you incorporated the Figma requirements (auto layout, components, consistent design system).
